

Right90 Sandbox™

Deploy and Test with Confidence and Speed

Right90 Solution for an Actionable Sales Forecast

Key Benefits

- ▶ **Reduce Risk:**
Develop and test integrations in a separate environment to ensure error-free deployment to the production environment.
- ▶ **Optimize Applications:**
Test multiple restructuring scenarios to ensure the best fit for your business model.
- ▶ **Deploy with Confidence:**
Minimize downtime and know that the applications you deploy will run optimally.
- ▶ **Simplify Training:**
Train new users before the applications go into production environments to maximize productivity.

Faster, Better Deployments

Develop and test your Right90 implementation without affecting your production environment. Right90 Sandbox provides a duplicate of your production environment for your Right90 implementation that gives you the flexibility to optimize and accelerate your Right90 deployment, without affecting daily business operations.

Working in the Sandbox environment, you can train employees and test business scenarios without the risk of data loss or downtime to your production environment. You can also optimize your application business model when restructuring business hierarchies or processes by trying various scenarios in the sandbox to find the best solution.

Right90 Sandbox reduces the risk of integration into your production environment, enabling you to quickly deploy a robust, error-free implementation. All of the same sales forecasting functionality is available for development and testing, including integration into a CRM environment, so you know exactly what you're deploying and can eliminate any inefficiencies or potential issues before you update production.

Sandbox Features

| | |
|-------------------------------|--|
| Functionality | Equal to production environments, including integration to CRM Sandbox. |
| User Access | Accommodates up to 100 users, who are given different login credentials (username/company name) to prevent confusion with production environment. |
| Refresh/Data Migration | Includes one refresh or copy from production to the sandbox environment per month. The copy is performed as a Tier 2 request and is available within three business days of the request. |
| Performance | Meets needs of training, testing and configuration, but is not equivalent to that of the production environment. |
| SLA | Equivalent to production environment with one business day notice of downtime for standard maintenance. |
| Support | Full support is provided for the sandbox environment. |

Companies may wish to license multiple sandboxes to handle different scenarios simultaneously. For example, some companies purchase a single sandbox for training and a separate sandbox for integration.
